DISASTERSIMULATOR

Explore the first 72 hours.

A transparent disaster-cascade simulator for the Netherlands.

Rik Stokmans • 4 September 2026

THE PREMISE

A disaster is not one failure.

It is a chain of dependencies, delays and constrained choices.

01 Shock

Wind, water, heat, cyber, ground motion or fire creates the initiating pressure.

02 Cascade

Power, telecom, water, mobility and supply degrade on different clocks.

03 Choice

Preparedness, backup, access and repair capacity change what happens next.

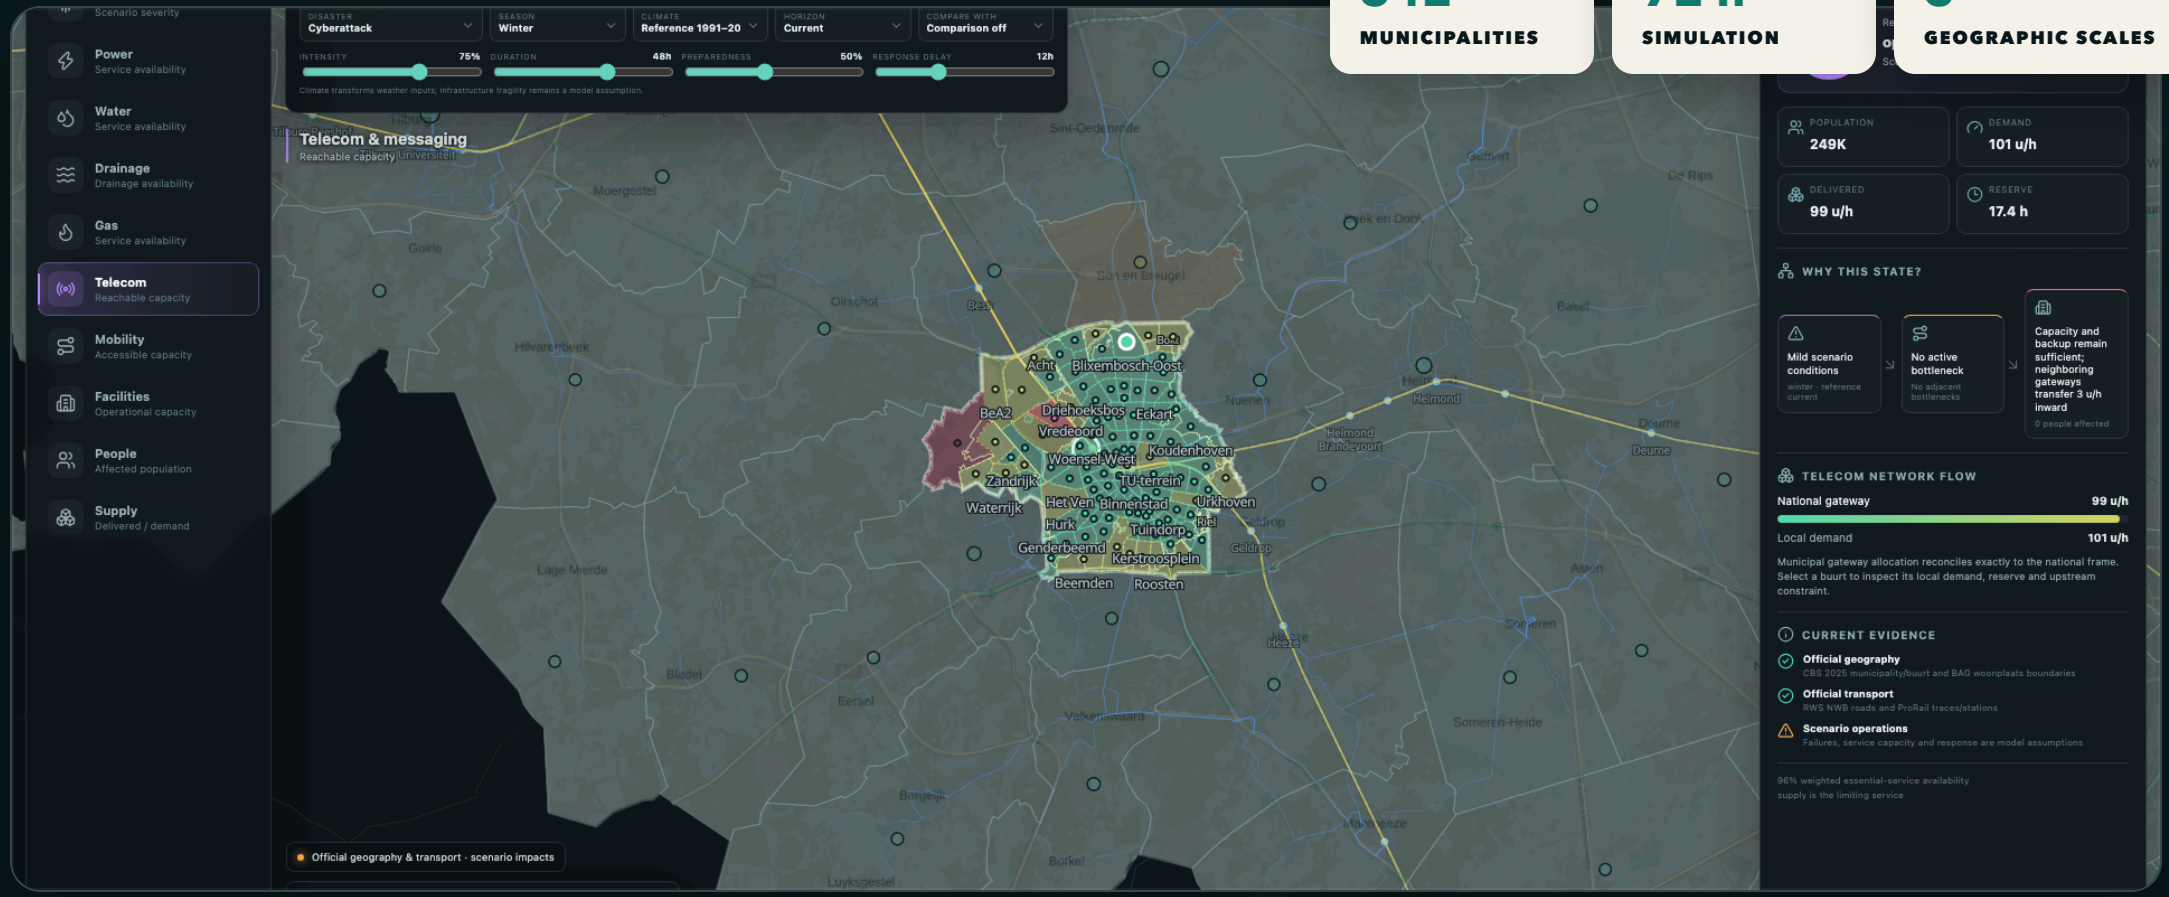

ONE COHERENT STATE

National overview. Local consequences.

342
MUNICIPALITIES

72 h
SIMULATION

3
GEOGRAPHIC SCALES

The same scenario, time and service state remain coherent while the view changes.

FROM COMPLEXITY TO CONVERSATION

Explore risk. Compare choices. Explain outcomes.

01

Explore the cascade

See how disruption can move between essential services and across the first 72 hours.

02

Compare responses

Change preparedness, backup or repair assumptions and inspect the downstream effect.

03

Explain the result

Keep drivers, uncertainty and public-data provenance visible at every geographic scale.

Built for exploration and decision support — not as a forecast or calibrated digital twin.

NL RESILIENCE LAB

THE INVITATION

See the cascade. Question the assumptions. Improve the response.
